## TB-mag Specifications

### **Thrust Balanced**

- ✓ Thrust-balanced, Sealless, non-metallic magnetic drive pump
- ✓ A revolutionary, patented, thrust balancing system eliminates the axial thrust created by the internal pump pressures.
- ✓ The balancing system is responsive, automatic and stable with any change in the fluid conditions such as flow, pressure or viscosity.
- ✓ Operate with less power by eliminating axial thrust loads. Less friction, less power....
- ✓ Expanded operating range, engineered to perform continuously over the entire flow range.
- ✓ Increased pump life and reliability with no forward thrust.

### **Double Welded Impeller**

- ✓ The inner magnets are protected by a patented hermetically sealed cover.
- ✓ For an extreme corrosion and permeation resistant barrier the magnet assembly is again hermetically sealed with a corrosion resistant fluoropolymer ETFE or PFA creating a double weld design.

### **Wear Rings**

- ✓ The Patented wear ring system prevents impeller from rubbing containment shell in the event of a primary bearing upset.
- ✓ Wear rings control leakage rates maintaining higher efficiencies.
- ✓ Wear Rings restrict solids > 0.005" from entering the containment shell area, keeping all bearings and critical flow paths clear.
- ✓ Concentrations to 30%, particulate sizes to 1/4"

### **Open Suction**

- ✓ A cantilever shaft supported in the containment shell eliminates the need for a shaft support in the pump's suction.
- ✓ No suction blockage, Lower NPSHr.

### **Pressurized Radial Bearing**

- ✓ Isolated from the suction pressure by a patented thrust balanced system, the radial bearings operate in a pressurized fluid environment.
- ✓ Pressure in the bearing area is approximately 1/3 of TDH which virtually eliminates the possibility of flashing.

### **Water Hammer Resistant**

- ✓ Burst pressures at 3000 psi give the TB-mag pump a 10 x safety factor and resistance to sudden system surges.

### **Modified Concentric Volute**

- ✓ All Innomag casings are designed to minimize radial loads and distribute pressure evenly across the entire flow range.
- ✓ Lowers stress on bearings and wear rings maximum pump life.

### **"True-Seal" Secondary Containment**

- ✓ A patented design combines a simple, yet proven, "off-the-shelf" dry run cartridge seal with our long couple bearing frame. Together, these products provide your service with true metallic secondary containment.

### **Expanded Operating Range**

- ✓ Engineered to perform continuously over the entire flow range.
- ✓ Operate at speeds 500 to 3500 rpm.

### **Universal Mounting**

- ✓ Connect a NEMA or IEC Frame Motor, Close or Long Coupled.

**Sealless**

- ✓ Non-slip, synchronous mag-drive pump.
- ✓ Leak free operation for a clean environment.
- ✓ Process lubricated, no external flush system needed.

**Trouble-free Maintenance**

- ✓ A back pull out design for quick in the field inspections or maintenance without disturbing the piping connections.
- ✓ Liquid end and drive end independently serviceable.
- ✓ Complete kits are available for impellers, containment shells and casings. No assembly.
- ✓ 100% replaceable wear parts including all rotating and stationary wear rings.

**Chemically Inert**

- ✓ All pump internals are molded with thick layer of mechanically tough, chemically inert ETFE or optional PFA fluoropolymer.
- ✓ Thickness from 0.125" to .375" (2.5 to 12.7mm)

**Armored Design**

- ✓ Ductile iron, the suit of armor protecting the pump from pipe strain, vibration, exterior shocks and handling.

**External Protection**

- ✓ All external parts are 100% coated for maximum protection.
- ✓ All mating and exposed metal surfaces are coated in a premium Epoxy/Epoxy Polyamide Primer and topped with a aliphatic acrylic polyurethane.

**Standard Dimension Process Pumps**

- ✓ Conforms to the requirements of ANSI B73.1
- ✓ Class 150 or 300 lb flanges, ISO PN 16 or JIS 10kg/cm<sup>2</sup> drilled flanges are optional
- ✓ Also available, International conformance to ISO 2858 pumps

**Performance**

- ✓ Temperature range of -20°F (-29°C) to 250°F (121°C)
- ✓ Capacities up to 1500 gpm (340 m<sup>3</sup>/hr)
- ✓ Heads up to 500 ft (152 m)
- ✓ Pressures up to 300 psi (2068 kPa)
- ✓ Power ranges are 1 to 75 hp ( 0.75 to 45 kW)

**Quality Assurance**

- ✓ All parts are manufactured to the highest possible standard of quality and workmanship.
- ✓ All completed pumps and wet ends must pass a 25 point quality inspection including, a running performance/endurance and pressure test prior to shipping.
- ✓ All critical components manufactured in house in our US Factory.

**TB-mag Part Features**
**Casing**

- ✓ One piece cast ductile iron.
- ✓ Bonded ETFE or PFA lining, minimum of 1/8" (3mm) thickness.
- ✓ Self venting, top centerline discharge design.
- ✓ Casing houses front stationary silicon carbide (SiC) wear ring and thrust bumper.
- ✓ ASME/ANSI B73.1 dimensions for flange position and foot print.
- ✓ Flanges: ASME/ANSI B16.5 class 150 hole pattern standard, class 300, ISO or JIS optional.
- ✓ Two bolt flanged drain with pure PTFE gasket and 316SS blind flange, standard.

**Impeller Assembly**

- ✓ Molded one-piece enclosed impeller made of carbon fiber-reinforced ETFE or PFA.
- ✓ High strength neodymium iron boron magnet assembly. Maximum size magnets in every impeller.
- ✓ One impeller per pump size.
- ✓ Double weld magnet assembly hermetically sealed from environment.
- ✓ High efficiency, low NPSHr impeller geometry.
- ✓ Fully open impeller eye; no shaft socket or support struts.
- ✓ Replaceable front and back rotating SiC wear rings.
- ✓ Impeller houses radial bearings and thrust control valve.

**Radial Bearings**

- ✓ Tandem bearing system made of pure sintered silicon carbide (SiC)
- ✓ Separately mounted for optimum alignment with shaft.
- ✓ Bearings separated by pure PTFE spacer.

**Pump Shaft**

- ✓ Replaceable, straight SiC shaft.
- ✓ Cantilevered design leaves impeller eye open for optimum NPSHr.
- ✓ Shaft oversized to handle any combinations of radial loads.

**Gasket**

- ✓ FEP/FKM (Fluorocarbon) o-ring standard. Provides universal chemical resistance.
- ✓ Other o-ring materials available on request.

**Containment Shell**

- ✓ One-piece molding of carbon fiber-reinforced ETFE or PFA.
- ✓ Outer pressure housing molded from a Aramid/Vinyl ester composite.
- ✓ Provides optimum combination of pressure and shock resistance.
- ✓ Reinforced shaft socket to handle any combination of radial loads.
- ✓ Zero eddy current losses for no heat operation and maximum possible efficiency.
- ✓ Front face houses stationary SiC wear ring.
- ✓ Internal ribs limit swirl to promote fast ejection of fine particles from containment shell.

**Containment Ring**

- ✓ One-piece ductile iron casting.
- ✓ Aligns and supports the containment shell.
- ✓ Jackscrew holes provided for easy disassembly.

**Outer Magnet Assembly**

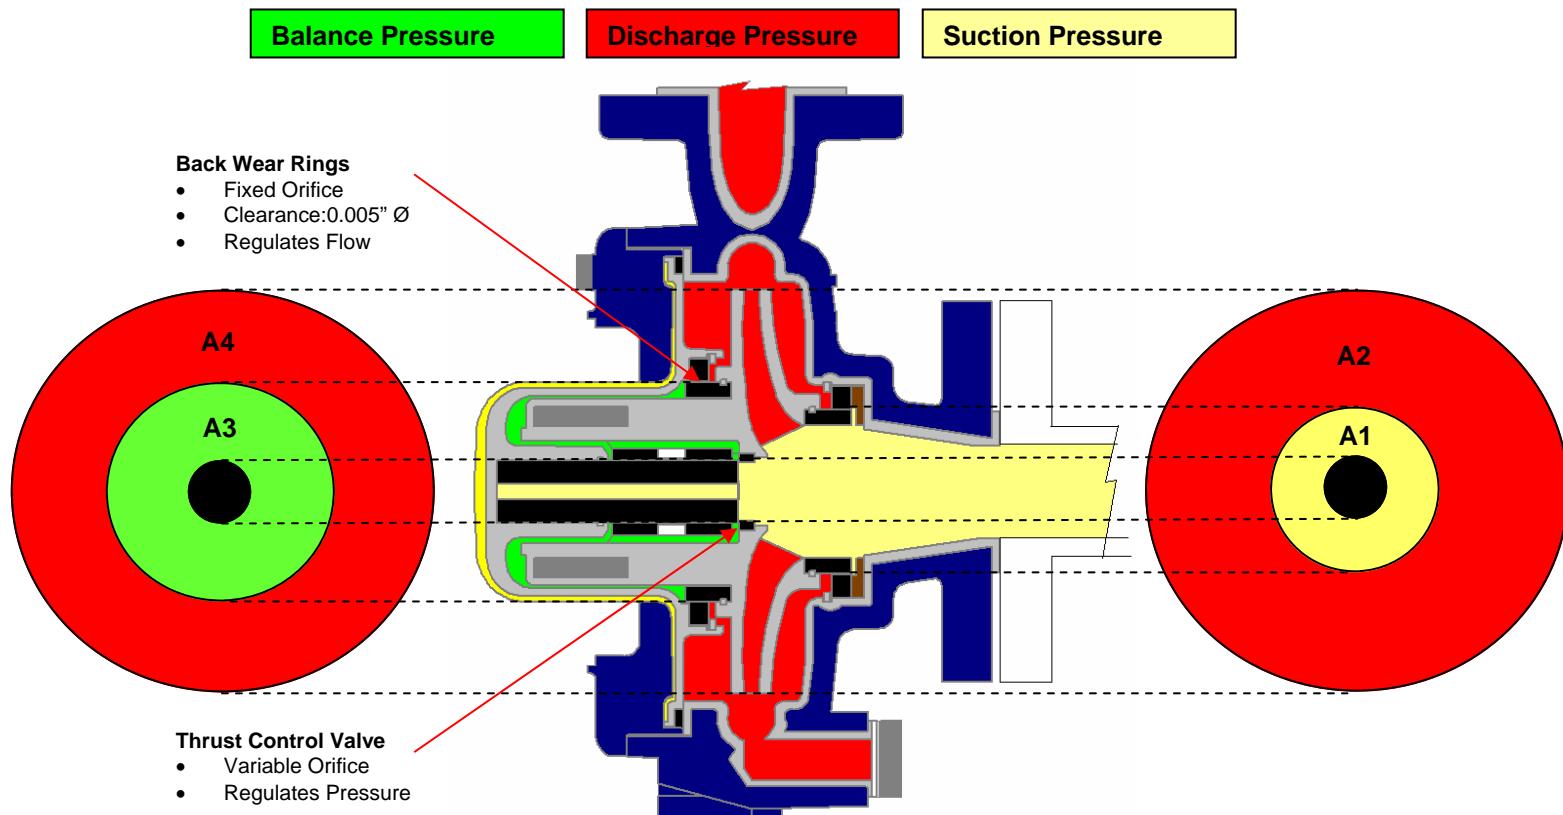

- ✓ Ductile iron shell with high strength neodymium iron boron magnets.
- ✓ One drive size per motor frame. Minimum possible inventory.
- ✓ Keyless hub for fast assembly.
- ✓ Jackscrew holes provided for easy removal from motor shaft.

**Adapter**

- ✓ One-piece ductile iron casting.
- ✓ Mounts to a wide range of standard NEMA and IEC C-face motors.
- ✓ Zero alignment required, just bolt it up.
- ✓ Back foot positioned for mounting directly to existing ANSI pump bases.

### Thrust Balancing

The TB-mag pumps create three distinct pressure regions around the impeller. These regions are the **suction pressure** in the impeller eye, the **discharge pressure** in the volute and the **balance pressure** behind the impeller (Figure 1). In operation, the balance pressure is approximately one quarter to one third of the discharge pressure. The discharge pressure is created by the routine pumping action of the impeller while the balance pressure is controlled by the combined action of a fixed orifice and a variable orifice. The fixed orifice is created by a set of clearance rings behind the impeller. These rings limit the leakage flow behind the impeller to a relatively constant rate. The leakage then flows around the magnets, past the bushing to the thrust control valve. This thrust control valve combined with the front of the shaft defines the variable orifice. Because the impeller is free to slide axially the variable orifice changes size. As conditions of service change for the pump the impeller will automatically compensate for the pressure change and remain thrust balanced. If the impeller moves forward, the valve is opened to a greater degree and the balance chamber pressure is reduced. This causes the impeller to react with a net force towards the motor. If the impeller moves backward, the valve is now closing and the balance chamber pressure increasing. This moves the impeller towards the suction. The balancing system is responsive, automatic and stable with any change in the fluid conditions such as flow, pressure or viscosity. Compare axial thrust loads in (Figure 2).

**Figure 1 – Thrust Balancing Pressures & Projected Areas.**

### Thrust Balancing Benefits

- The balancing system is responsive, automatic and stable with any change in the fluid conditions such as flow, pressure or viscosity.
- Operate with less power by eliminating axial thrust loads. Less friction, less power....
- Expanded operating range, engineered to perform continuously over the entire flow range.
- Increased pump life and reliability with no forward thrust.

### Thrust Balancing Engineering

To help clarify how our thrust balancing system works lets calculate the projected axial areas shown in Figure 1. The four areas, **A1**, **A2**, **A3** and **A4** represent the four main pressure areas affecting the forces on both the front and back of the impeller. The four areas are:

- **A1** - suction pressure area on front shroud of impeller (zero pressure)
- **A2** - discharge pressure area on front shroud of impeller (discharge pressure)
- **A3** - balance chamber pressure area on back shroud/magnet of impeller (between suction and discharge controlled by thrust balance system, approximately 1/3 to 1/4 of discharge pressure)
- **A4** - discharge pressure on back shroud of impeller. (discharge pressure) The unmarked areas at the very center represent the pump shaft which is not attached to the impeller and therefore doesn't affect the thrust forces.

The forces acting on each of these areas is the product of the area times the pressure and the sum of the forces on the front must equal the sum of forces on the back. This can be written as:

$$P1*A1+P2*A2 = P3*A3+P4*A4$$

Where **P1** is the suction pressure, **P2** is discharge, **P3** is the balance chamber pressure and **P4** is also discharge pressure.

Now, **P2 = P4** and **P1=0** then,

$$P3*A3=P4*(A2-A4) \quad \text{or}$$

$$P3=P4*(A2-A4)/A3$$

In the TB-mag design, **A2>A4** so **P3** is a positive value and solely a function of the discharge pressure and the areas of the impeller wear rings.

The second important concept in the TB-mag system is how the pressure, **P3** acting on area **A3** is kept at exactly the value required to balance the system. This is accomplished by allowing the impeller to float freely in the axial direction. If the forces on the back of the impeller are greater than those on the front then the impeller is displaced forward (towards the suction). This causes the clearance between the valve and the end of the shaft to increase. This allows more fluid to exit from area **A3** and drops pressure **P3** until **P3** again balances the forces. Displacement of the impeller towards the back causes the valve-to-shaft clearance to decrease, increasing the **P3** until it balances the system. Pressures in areas **A1**, **A2** and **A4** are not affected by the impeller movement. In practice this is a very stable control system that requires pressure to operate. This system works effectively from the minimum thermal flow limit (typically a few gpm) to run-out provided the pump is generating pressure.

This simplified explanation of the axial forces doesn't include all secondary effects that can vary the pressures over the areas but does a reasonable job of describing the system. The TB-mag system is fully thrust balanced when operating to the left and right of BEP provided the pump is generating pressure and not operating in a cavitated state or very close to shut-off.

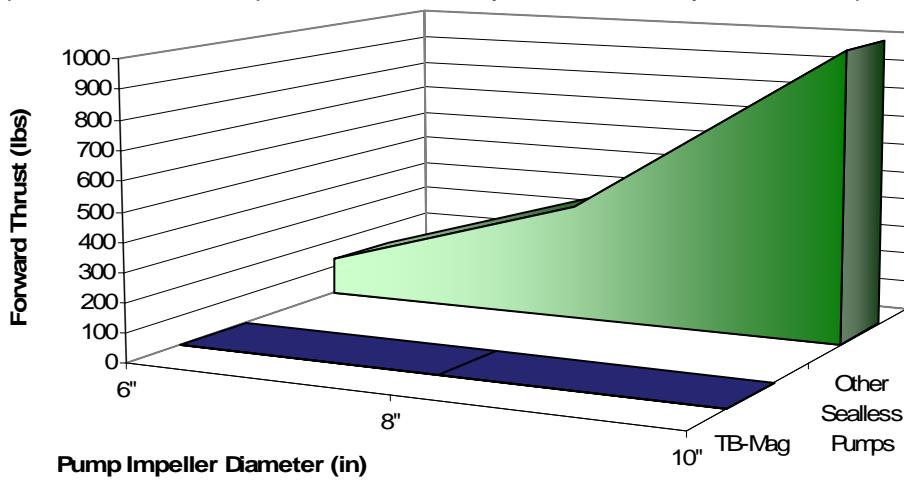

Figure 2 – Forward Thrust Comparison

### TB-mag Solids Handling

Solids enter the pump through the suction and pass out through the discharge nozzle. Some of the solids will try to leak around the impeller past the wear rings. The leakage past the front wear rings simply returns the particles directly to the suction flow. However, leakage past the back wear rings could bring particles in contact with the inner magnets, the containment shell and the radial bearings. Fortunately, wear rings restrict solids  $> 0.005"$  from entering the containment shell area, keeping all bearings and critical flow paths clear. Figure 1, illustrates the main solids laden stream around the impeller and the clean stream behind the impeller. No other non metallic mag-drive keeps the solids from entering these critical areas behind the impeller.

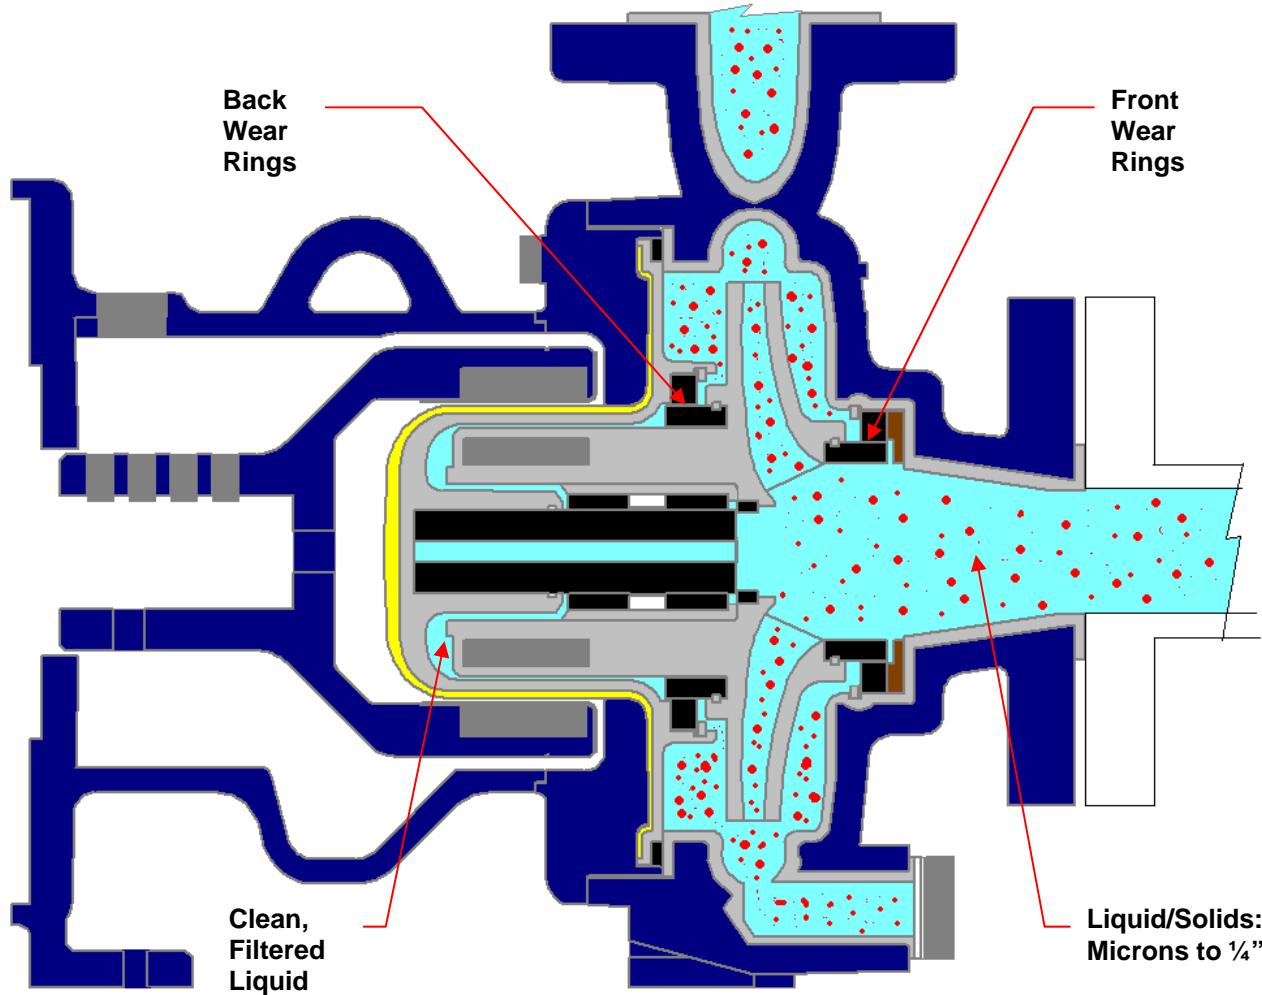

Figure 1 - Solids passing through the pump

### Solids Handling Considerations

Maximum Pump Life

Minimum Pump Life

- Low percentage of solids
- Fine, smooth, spherical shaped particles
- Softer particles or flakes
- Suspended, uniform solids
- Low or variable speed operation
- Operate at or near BEP
- Continuous Duty

- High percentage of solids
- Sharp, irregular shaped, large particles
- Hard particles, silica sand (Silicon Dioxide), etc.
- Fibrous, sticky or scale forming solids
- High speed operation
- Operation near shut off or end of curve
- Intermittent duty, solids settle

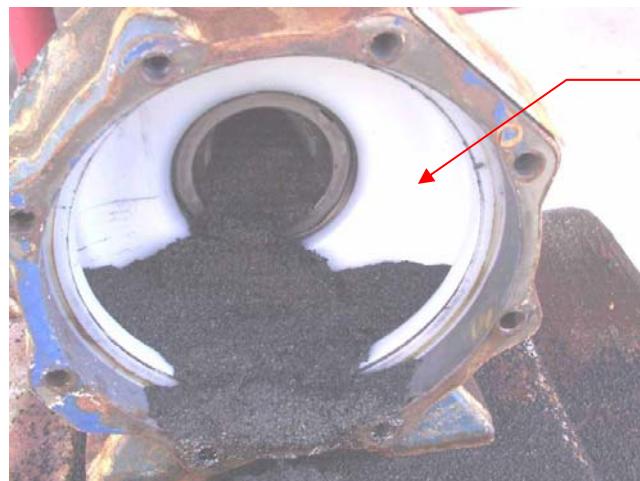

**Case Study - Extreme Solids Handling**

**Application:** Approx. 65% Carbon Slurry

**Current problem:** Existing mechanical seal pump would have weekly seal failures.

**Trial Pump:** TB-mag A, 3x2x6, 10 hp motor, 3600 rpm

**Results:** The TB-mag pump ran 9 months. The internal filtering system kept the bearings and inner magnet assembly clean and free from the carbon slurry. The slurry eroded the impeller vanes away separating the front shroud from the back shroud.

**No wear on the casing lining.**

Vanes eroded away separating the back and front shrouds.

**Figure 2 – Carbon Slurry**

**Figure 3 – Front of impeller, no vanes**

**Figure 4 – No wear on magnet assembly**

**Patented Permeation Protection**

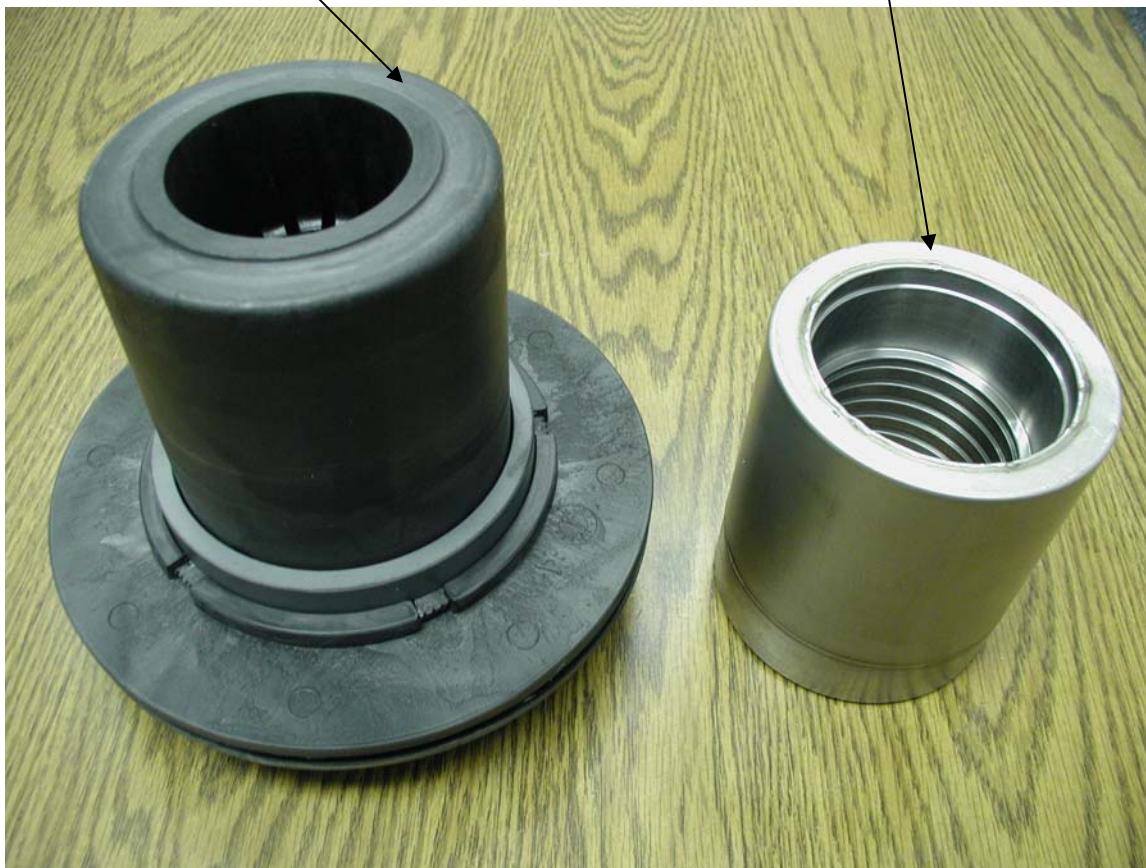

Effectively, all plastics are semi-permeable. This means that they allow small atoms, ions or molecules present in the pumped fluid to pass between their molecules like a very fine sieve. Many of these materials are very corrosive. This normally doesn't affect the plastic but can allow the corrosive products to attack the underlying materials. By far the most vulnerable parts of any pumps are the magnets. Our pumps are made using neodymium-iron-boron magnets which are the strongest available but not very corrosion resistant.

To combat permeation and give the longest life possible all Innomag pumps utilize a patented double welded magnet assembly. On the outside, the magnet assembly is hermetically sealed under the fluoropolymer plastic covering. Underneath the plastic, the magnets are hermetically sealed to the magnet carrier by welding on a 316L stainless cover. This second barrier stops permeate from reaching the magnets.

From the Umag on up, all Innomag models are manufactured using this technology.

TBmag-B, 1.5x1x8 impeller magnet showing sealed magnet assembly under fluoropolymer cover.

Same impeller looking at the stainless cover over the magnets.

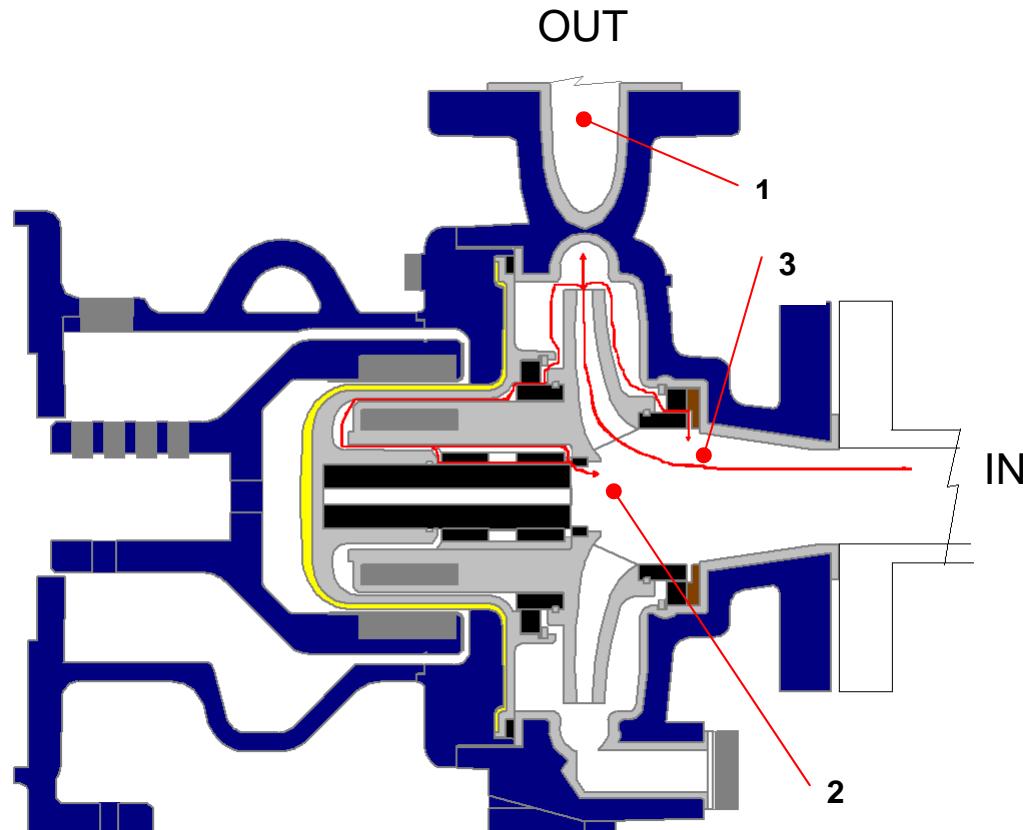

### TB-mag Flowpath

All Innomag pumps are product lubricated; meaning the liquid being pumped is the same liquid that lubricates and cools the internal bearings and wear rings. It's critical for the pump to have and maintain adequate suction pressure.

To help visualize the flow path/internal recirculation of the TB-mag pump view Figure 1. As liquid enters the pumps suction it quickly accelerates into the impeller eye then discharged radially into the volute. The pressurized liquid splits three ways.

- 1) The mainstream of the liquid will efficiently discharge out of the casing.
- 2) A small percentage of the liquid (approximately 2-3 gpm) flows around the impeller through the rear wear rings, around the magnet assembly then splitting over and under the journal bearings before releasing past the control valve to the impeller suction.
- 3) The rest of the liquid returns to the impeller suction through the front wear rings and thrust collar.

**Figure 1 – TB-mag Flow Path**

For maximum pump life consider the following:

- 1) Flooded Suction, liquid must flow to the pump naturally.
- 2) Net Positive Suction Head available is greater than required,  $NPSH_a > NPSH_r$
- 3) Minimize suction pipe length, bends and restrictions.
- 4) Always run the pump above the minimum flow required.

**Pump Identification Code-ANSI**

**Wet End A | 1 | 6 | 6 | 5 | 1 | 1 | 1 | 0 | 0 - A | B | 0 | Drive End**

**TB-mag Models**

**Note:**

Verify the pump serial and casing revision number with Innomag to make sure the correct thrust collar is used.

<b>Item:</b>	<u>73</u>	<b>Qty:</b>	<u>1</u>	<b>Part Name:</b>	<u>Gasket, O-Ring</u>
<b>Detail:</b>	A. Replaceable, FEP/FKM o-ring standard. Provides universal chemical resistance. B. Square cross section: 0.210 x 0.210, more sealing surface than traditional O-rings. C. Optional Materials are FKM (Fluorocarbon) or EPDM. Others available upon request. D. Positioned between the Casing and Containment Shell.				

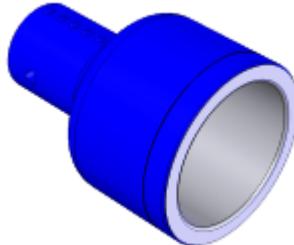

<b>Model</b>	<b>Size/Description</b>	<b>Standard</b>	<b>Option 1</b>	<b>Option 2</b>

<b>Item:</b>	<u>231</u>	<b>Qty:</b>	<u>1</u>	<b>Part Name:</b>	<u>Shell, Containment</u>
<b>Detail:</b>	A. One-piece molding of carbon fiber-reinforced Fluoropolymer ETFE or PFA. B. Outer pressure housing molded from Aramid/Vinyl ester composite. C. Aramid provides optimum combination of pressure and shock resistance. D. Reinforced shaft socket to handle any combination of radial loads. E. Zero eddy current losses for no heat operation and maximum possible efficiency. F. Front face houses stationary SiC wear ring. G. Internal ribs limit swirl to promote fast ejection of fine particles from containment shell.

### Recommended Spare Parts

This recommended spare parts list is intended to assist our customers in maintaining an adequate spare parts inventory based on the severity of the service. To prevent system downtime, we recommend that you have these spares on site.

## 1. Normal, non-abrasive service

(For preventative maintenance pump inspections)

### Gasket, O-Ring

Model	Size/Description	Standard		Option 1		Option 2	
		Material:	FEP/FKM	Material:	FKM	Material:	EPDM
TB	A	GTO-1003-SI		GTO-1004-SI		GTO-1005-SI	
	B/C 8"	GTO-1013-SI		GTO-1014-SI		GTO-1015-SI	
	C 10"	GTO-1023-SI		GTO-1024-SI		GTO-1025-SI	

## 2. Abrasive, low viscosity or low NPSHa service

(Replace wear parts)

### Bushing, Bearing

Model	Size/Description	Standard		Option 1	
		Material:	SiC	Material:	SiC+ DLC
TB	A – 1.000" I.D. (2-Required)	BGB-1005-SI			
	B/C – 1.500" I.D. (2-Required)	BGB-1015-SI			
	A – Bearing Spacer (1-Required)	BGB-1050-SI			
	B/C – Bearing Spacer (1-Required)	BGB-1060-SI			

### Gasket, O-Ring

Model	Size/Description	Standard		Option 1		Option 2	
		Material:	FEP/FKM	Material:	FKM	Material:	EPDM
TB	A	GTO-1003-SI		GTO-1004-SI		GTO-1005-SI	
	B/C 8"	GTO-1013-SI		GTO-1014-SI		GTO-1015-SI	
	C 10"	GTO-1023-SI		GTO-1024-SI		GTO-1025-SI	

### Shaft, Pump

Model	Size/Description	Standard		Option 1	
		Material:	SiC	Material:	SiC + DLC
TB	A-Series - O.D. = 1.00" (Before 9-1-2007)	STP-1000-SI			
	A-Series - O.D. = 1.00" (Current)	STP-1005-SI			
	B/C-Series - O.D. = 1.50" (Before 9-1-2007)	STP-1010-SI			
	B/C-Series - O.D. = 1.50" (Current)	STP-1015-SI			

### 3. Critical services

(When fast repairs from major upsets are required the following pre-assembled cartridges are recommended)

#### Impeller Magnet, Complete

(Includes 1-Impeller, 2-Bushing Bearings, 2-Wear Rings, 1-Control Valve, 1-Set of Retaining Pins, Labor)

Model	Size/Description	Standard	Option 1		
		Impeller:	CF/ETFE	Impeller:	CF/PFA

**NO DISTRIBUTOR DISCOUNTS APPLY.**

All prices are per single pump. Hydrostatic test price is for complete pump wet end.

- 1) Includes letter of Certification.
- 2) Performance test guarantee is for duty point only.
- 3) Prices are per pump per day.

### WEG Motor Price List

WEG's W21™ NEMA Premium motors meet or exceed all NEMA Premium and CEE requirements for energy efficiency. These TEFC motors are built according to NEMA specifications and designed for operation in moist or dusty atmospheric conditions without affecting their useful life. Premium Efficiency WEG motors are tested according to IEEE 112 std., method 'B' and their efficiency values are certified by UL Labs (CSA C390) and NEMA MG1.12.53, both A and B Standards. These motors are NEMA Design 'B' and maintain exceedingly high breakdown and locked torque while providing the highest rated efficiency levels.

## Power Monitor & Current Transformer Price List

**Emotron EL-FI M20 Shaft Power Monitors** for pumps, machines and processes offer you:

- Protecting, Viewing and Controlling

**Protection** - Pre-alarm, alarm and stop before any machine over or under load damage occurs. This increase life time and reduce spare parts requirements.

**All in one** - You will readout the motor shaft power in % of rated power, kW or HP. The analogue output signal can be scaled to desired shaft power range and used as an input to controllers etc. Furthermore, two relay outputs.

**Easy to install** - No sensors or sensor cables. This results in less components and easy set and start up. Alarm functions can be set within three seconds at just one push of a key.

- It is applicable for all kinds of pumps, mixers, agitators, blenders, scrapers, conveyers, machine tools, automatic gates and doors.

In other words – EL-FI M20 takes care of your equipment before it is too late.

BKM-1037-FM 	2	ANSI Wet end riser, GP1 pump to 180mm CL	1.84	2.5	2	0.625	
BKM-1041-FM 	2	Motor riser, 28 frame to 8.25" CL	1.25	5	2	0.625	
BKM-1053-FM 	2	Motor riser, 25 frame on 8.25" CL, 32 frame on 10" CL	2.00	5	3	1/2-13	
BKM-1057-FM 	2	Motor riser, 160mm to 8.25" CL	1.951	5	3	M12 x 1.75	
BKM-1065-FM 	2	Motor riser, 21 frame on 8.25" CL	3.00	3	3	3/8-16	
BKM-1066-FM 	2	Motor riser, 28 frame on 10" CL	3.00	3	3	1/2-13	

**Pump & Motor Block-Continued**

Part Number	# Req.	Description	Height	Length	Width	Hole	\$/Each
BKM-1067-FM 	2	Motor riser, IEC 180 to 10" CL	2.91	3	3	M12 x 1.75	
BKM-1071-FM 	2	Motor riser, 21 frame on 10" CL	4.75	4	3	3/8-16	
BKM-1072-FM 	2	Motor riser, 25 frame on 10" CL	3.75	3	3	1/2-13	
BKM-1073-FM 	2	Motor riser, 160MM TO 10" CL	3.701	3	3	M12 x 1.75	
BKM-1074-FM 	2	Motor riser, 132MM TO 10" CL	4.701	3	3	M10 x 1.5	
BKM-1080-FM 	1	Wet end riser, GP1 to GP2 mounting block, front feet only	3	2	12	1/2-13	
BKM-1100-FM 	1	Pump end riser, GP1 to GP2 mounting block	3	14.5	12	1/2-13	
BKM-1110-FM 	1	Pump end riser, GP1 to 10.00" CL	4.75	14.5	12	1/2-13	
BKM-1210-FM 	1	Special riser for 3x1.5x6 on Iwaki MDFL 657 / 6510 footprint	1.875	16.1	10.4	M12 x 1.75	

### Pump & Motor Block-Continued

Part Number	# Req.	Description	Height	Length	Width	Hole	\$/Each
BKM-1215-FM 	1	Special riser for 3x1.5x6 on Iwaki MDFL 507 / 5010 footprint	1.875	16.1	10.4	M12 x 1.75	
FTA-0900-SI 	1	U-mag Adapter Foot	-	-	-	-	
FTA-0905-FM 	1	Pump end riser, U-mag to 5.25" CL , For 21 frame motor	0.75	2.5	2.5	10.5mm	
FTA-0910-FM 	1	Pump end riser, U-mag to 6.1" CL	1.6	2.5	2.5	10.5mm	
FTA-0916-FM 	2	Pump end riser, U-mag to Iwaki MDFL 405 footprint **(Sold as a Pair Only)	1.5	12.5	3	M12 x 1.75	
FTA-1000-SI 	1	Group 2 mounting foot, 8.25" centerline	-	-	-	-	
FTA-1010-FM 	2	Adapter riser for 6410 to 10" CL	1.75	ø1.125	ø.563	-	
FTA-1015-FM 	1	Adapter riser for ANSI-IEC - raise adapter from GP1 height to 160mm CL, (ADP-1015)	1.049	2	5.375	15mm	
FTA-1016-FM 	1	Adapter riser for ANSI-IEC - raise adapter from 132mm height to 160mm CL, (ADP-1005)	1.102	2	5.375	15mm	
FTA-1017-FM 	1	Adapter riser for ANSI-IEC - raise adapter from GP1 height to 180mm CL, (ADP-1015)	1.84	2	5.375	15mm	

*Innomag vs. Competition*

## Design Features & Benefits:

	<b>INNOMAG TB-mag</b>	<b>Goulds 3298</b>	<b>ANSIMAG K-Series</b>	<b>Finnish Th. UC Series</b>	<b>Iwaki MDM, MDFL</b>
<b>Thrust Balanced</b>	<ul style="list-style-type: none"> <li>✓ Thrust-balanced, Sealless, non-metallic magnetic drive pump.</li> <li>✓ A revolutionary, patented, thrust balancing system eliminates the axial thrust created by the internal pump pressures.</li> <li>✓ The balancing system is responsive, automatic and stable with any change in the fluid conditions such as flow, pressure or viscosity.</li> <li>✓ Operate with less power by eliminating axial thrust loads. Less friction, less power....</li> <li>✓ Expanded operating range, engineered to perform continuously at any flow.</li> <li>✓ Increased pump life and reliability with no forward thrust.</li> </ul>	YES	NO	NO	NO
<b>Double Welded Impeller</b>	<ul style="list-style-type: none"> <li>✓ The inner magnets are protected by a patented hermetically sealed cover.</li> <li>✓ For an extreme corrosion and permeation resistant barrier the magnet assembly is again hermetically sealed with a corrosion resistant fluoropolymer ETFE or PFA creating a double weld design.</li> </ul>	YES	NO	NO	NO
<b>Wear Rings</b>	<ul style="list-style-type: none"> <li>✓ The Patented wear ring system prevents impeller from rubbing containment shell in the event of a primary bearing upset.</li> <li>✓ Wear rings control leakage rates maintaining higher efficiencies.</li> <li>✓ Wear Rings restrict solids &gt; 0.005" from entering the containment shell area, keeping all bearings and critical flow paths clear.</li> <li>✓ Concentrations to 30%, particulate sizes to 1/4"</li> </ul>	YES	NO	NO	NO
<b>Open Suction</b>	<ul style="list-style-type: none"> <li>✓ A cantilever shaft supported in the containment shell eliminates the need for a shaft support in the pump's suction. <u>No suction blockage, Lower NPSHr.</u></li> </ul>	YES	NO	NO	NO
<b>Pressurized Radial Bearing</b>	<ul style="list-style-type: none"> <li>✓ Isolated from the suction pressure by a patented thrust balanced system, the radial bearings operate in a pressurized fluid environment.</li> <li>✓ Pressure in the bearing area is approximately 1/3 of TDH which virtually eliminates the possibility of flashing.</li> </ul>	YES	NO	NO	NO
<b>Water Hammer Resistant</b>	<ul style="list-style-type: none"> <li>✓ Burst pressures at 3000 psi give the TB-mag pump a 10 x safety factor and resistance to sudden system surges.</li> </ul>	YES	NO	NO	NO
<b>Modified Concentric Volute</b>	<ul style="list-style-type: none"> <li>✓ All Innomag casings are designed to minimize radial loads and distribute pressure evenly across the entire flow range.</li> <li>✓ Lowers stress on bearings and wear rings maximum pump life.</li> </ul>	YES	NO	YES	YES
<b>"True-Seal" Secondary Containment</b>	<ul style="list-style-type: none"> <li>✓ A patented design combines a simple, yet proven, "off-the-shelf" dry run cartridge seal with our long couple bearing frame. Together, these products provide your service with true metallic secondary containment.</li> </ul>	YES	NO	NO	NO
<b>Expanded Operating Range</b>	<ul style="list-style-type: none"> <li>✓ Engineered to perform continuously over the entire flow range.</li> <li>✓ Operate at speeds 500 to 3500 rpm.</li> </ul>	YES	NO	NO	NO
<b>Standard Dimension Process Pumps</b>	<ul style="list-style-type: none"> <li>✓ Conforms to the requirements of ANSI B73.1</li> <li>✓ Class 150 or 300 lb flanges, ISO PN 16 or JIS 10kg/cm<sup>2</sup> drilled flanges are optional.</li> <li>✓ International conformance to ISO 2858 pumps.</li> </ul>	YES	YES	YES	YES
<b>Quality Assurance</b>	<ul style="list-style-type: none"> <li>✓ All parts are manufactured to the highest possible standard of quality and workmanship.</li> <li>✓ All completed pumps and wet ends must pass a 25 point quality inspection including, a running performance/endurance and pressure test prior to shipping.</li> <li>✓ All critical components manufactured in house in our US Factory.</li> </ul>	YES	NO	NO	NO
